Test Plan

Program for the product is Python.

Test Number	Purpose of Test	Test Data	Expected Result	Actual Result	Comments
01	Testing if the try, Except loop for typecasting and range checking num_games	player_id = 1 num_games = 7	Passes try, catch loop		
02	Same as above: Changing test data to be erroneous to test if it accepts it.	player_id = 1 num_games = ten	Typecasting raises a ValueError, which is caught by the Try, Except and prints the associated error message and loops.		
03	Same as Test 01 Changing test data to be erroneous to check second exception.	player_id = 1 num_games = 11	If statement is Truthful and raises an exception, which is caught by the try, except loop and prints associated error.		
04	Same as Test 01 Changing test data to be boundary data, to see if it will accept it	player_id = 1 num_games = 10	If statement is not Truthful and therefore will not trigger.		
05	Testing second Try,	player_id = 1	Passes try except and if		

	Except loop used for range checking and typecasting	num_games = 7 score = 5 game_length = 30	statement, goes through and continues		
06	Same as 05 but uses erroneous data testing typecasting	player_id = 1 num_games = 7 score = 5 game_length = thirty	Typecasting raises ValueError, prints associated error message and loops		
07	Same as 06 but tests if statement	player_id = 1 num_games = 7 score = 5 game_length = 999	If statement is truthful, raises exception which is caught and prints associated error message, loops back.		
08	Same as 05, but instead uses boundary data for game_length to see if the if statement will accept it	player_id = 1 num_games = 7 score = 5 game_length = 5	If statement is not truthful and passes the try except.
